

Lab03 - PySpark

Speaker: Wei-Lun Tseng
ECE, NYCU

eric840610.ee02@g2.nctu.edu.tw

Class Schedule

Total: 5 points

- Lab-1: PySpark Warmup
- Lab-2: PySpark Exercise

Python and Spark

- In this course the main way we will be working with Python and Spark is through the DataFrame Syntax.
- If you've worked with pandas in Python, R, SQL or even Excel, a DataFrame will feel very familiar!

Python and Spark

- Spark DataFrames hold data in a column and row format.
- Each column represents some feature or variable.
- Each row represents an individual data point.

Python and Spark

- Spark began with something known as the “RDD” syntax which was a little ugly and tricky to learn.
- Now Spark 2.0 and higher has shifted towards a DataFrame syntax which is much cleaner and easier to work with!

Python and Spark

- Spark DataFrames are able to input and output data from a wide variety of sources.
- We can then use these DataFrames to apply various transformations on the data.

Python and Spark

- At the end of the transformation calls, we can either show or collect the results to display or for some final processing.
- In this section we'll cover all the main features of working with DataFrames that you need to know.

Python and Spark

- Once we have a solid understanding of Spark DataFrames, we can move on to utilizing the DataFrame MLlib API for Machine Learning.

輕鬆共用

無論你是學生、數據資料學家或是 AI 研究人員，Colab 都能讓你的工作事半功倍。請觀看 [Colab 的簡介影片](#) 瞭解詳情，或是直接瀏覽以下的新手入門說明！

開始使用

你正在閱讀的文件並非靜態網頁，而是名為 **Colab 筆記本** 的互動式環境，可讓你撰寫和執行程式碼。

舉例來說，以下是包含簡短 Python 指令碼的 **程式碼儲存格**，可進行運算、將值儲存至變數中並列印運算結果：

```
[ ] seconds_in_a_day = 24 * 60 * 60
    seconds_in_a_day
```

86400

如要執行上方儲存格中的程式碼，請按一下進行選取，再按一下程式碼左側的播放鍵，或是使用鍵盤快速鍵「Command/Ctrl + Enter 鍵」。按一

What is Colaboratory?

Colaboratory, or "Colab" for short, allows you to write and execute Python in your browser, with

- Zero configuration required
- Free access to GPUs
- Easy sharing

Whether you're a **student**, a **data scientist** or an **AI researcher**, Colab can make your work easier. Watch [Introduction to Colab](#) to learn more, or just get started below!

Getting started

The document you are reading is not a static web page, but an interactive environment called a **Colab notebook** that lets you write and execute code.

For example, here is a **code cell** with a short Python script that computes a value, stores it in a variable, and prints the result:

```
[ ] seconds_in_a_day = 24 * 60 * 60
    seconds_in_a_day
```

86400

To execute the code in the above cell, select it with a click and then either press the play button to the left of the code, or use the keyboard shortcut "Command/Ctrl+Enter". To edit the code, just click the cell and start editing.

Installation for Pyspark

```
[ ] 1 !apt-get -y install openjdk-8-jre-headless
    2 !pip install pyspark
```

Start a simple Spark Session

```
[ ] 1 import pyspark
    2 from pyspark.sql import SparkSession
    3 from pyspark.sql.types import StringType, StructType, IntegerType, StructField
    4 spark = SparkSession.builder.appName('Warmup').getOrCreate()
```

Data Schema

```
[ ] 1 data_schema = [StructField('age', IntegerType(), True),
    2               StructField('name', StringType(), True)]
    3 final_struct = StructType(fields=data_schema)
    4
```

Load the people.json file, have Spark infer the data types.

```
[ ] 1 df = spark.read.json('people.json', schema=final_struct)
```

To execute the code in the above cell, select it with a click and then either press:
shortcut "Command/Ctrl+Enter" To edit the code, just click the cell and start editing.

▼ Start a simple Spark Session

```
[2] 1 import pyspark
    2 from pyspark.sql import SparkSession
    3 from pyspark.sql.types import StringType, StructType, IntegerType, StructField
    4 spark = SparkSession.builder.appName('Warmup').getOrCreate()
```

Data Schema

```
[3] 1 data_schema = [StructField('age', IntegerType(), True),
    2                 StructField('name', StringType(), True)]
    3 final_struct = StructType(fields=data_schema)
    4
```

Load the people.json file, have Spark infer the data types.

```
[5] 1 df = spark.read.json('people.json', schema=final_struct)
```

▼ What are the column names?

```
[6] 1 df.columns

['age', 'name']
```

▼ What is the schema?

```
[7] 1 df.printSchema()

root
 |-- age: integer (nullable = true)
 |-- name: string (nullable = true)
```

Show whole DataFrame

```
1 df.show()
2
```

```
+---+-----+
| age | name |
+---+-----+
| null | Michael |
| 30 | Andy |
| 19 | Justin |
+---+-----+
```

Print out the first 2 rows.

```
[9]  1 # Didn't strictly need a for loop, could have just then head()
    2 for row in df.head(2):
    3     print(row)
    4     print('\n')
```

```
Row(age=None, name='Michael')
```

```
Row(age=30, name='Andy')
```

Use describe() to learn about the DataFrame

```
[10]  1 df.describe()
```

```
DataFrame[summary: string, age: string, name: string]
```

Use another data frame to learn about the statistical report

```
[11]  1 temp = df.describe()
    2 temp.show()
```

```
+-----+-----+-----+
|summary|      age|   name|
+-----+-----+-----+
|  count|         2|      3|
|   mean|      24.5|   null|
| stddev|7.7781745930520225| null|
|    min|         19|   Andy|
|    max|         30|Michael|
+-----+-----+-----+
```

There are too many decimal places for mean and stddev in the describe() dataframe.
How to deal with it?

```
[13]  1 from pyspark.sql.functions import format_number
```

```
1 result = df.describe()
2 result.select(result['summary'],
3               format_number(result['age'].cast('float'),2).alias('age'))
4         ).show()
```

```
+-----+-----+
|summary|  age|
+-----+-----+
|  count| 2.00|
|   mean|24.50|
| stddev| 7.78|
|    min|10.00|
```

Get the mean of age directly

```
[15] 1 from pyspark.sql.functions import mean
      2 df.select(mean("age")).show()
```

```
+-----+
|avg(age)|
+-----+
|    24.5|
+-----+
```

What is the max and min of the Volume column?

```
[16] 1 # Could have also used describe
      2 from pyspark.sql.functions import max,min
      3 df.select(max("age"),min("age")).show()
```

```
+-----+-----+
|max(age)|min(age)|
+-----+-----+
|      30|       19|
+-----+-----+
```

How many days was the age smaller than 30?

```
[17] 1 df.filter("age < 30").count()
```

1

```
1 from pyspark.sql.functions import count
2 result = df.filter(df['age'] < 30)
3 result.select(count('age')).show()
```

```
+-----+
|count(age)|
+-----+
|          1|
+-----+
```

people.json X

```
1 {"name": "Michael"}
2 {"name": "Andy", "age": 30}
3 {"name": "Justin", "age": 19}
4
```

Spark DataFrames Project Exercise

Let's get some quick practice with your new Spark DataFrame skills, you will be asked some basic questions about some stock market data, in this case Walmart Stock from the years 2012-2017. This exercise will just ask a bunch of questions, unlike the future machine learning exercises, which will be a little looser and be in the form of "Consulting Projects", but more on that later!

For now, just answer the questions and complete the tasks below.

[Hint](#)

- ▼ Use the walmart_stock.csv file to Answer and complete the tasks below!

```
[ ] 1 !apt-get -y install openjdk-8-jre-headless
    2 !pip install pyspark
    3
```

```
Reading package lists... Done
Building dependency tree
Reading state information... Done
openjdk-8-jre-headless is already the newest version (8u275-b01-0ubuntu1~18.04).
0 upgraded, 0 newly installed, 0 to remove and 14 not upgraded.
Requirement already satisfied: pyspark in /usr/local/lib/python3.6/dist-packages (3.0.1)
Requirement already satisfied: py4j==0.10.9 in /usr/local/lib/python3.6/dist-packages (from pyspark) (0.10.9)
```

▼ Use the walmart_stock.csv file to Answer and complete the tasks below!

```

Check Point 4

What is the max and min of the Volume column?

```
[19] 1 # Could have also used describe  
      2 from pyspark.sql.functions import max,min
```

```
[20] 1
```

```
+-----+-----+  
|max(Volume)|min(Volume)|  
+-----+-----+  
|  80898100|   2094900|  
+-----+-----+
```

▼ How many days was the Close lower than 60 dollars?

```
[24] 1 df.filter("Close < 60").count()
```

```
81
```

```
[23] 1 df.filter(df['Close'] < 60).count()
```

```
81
```

```
[26] 1 from pyspark.sql.functions import count
      2 result = df.filter(df['Close'] < 60)
      3 result.select(count('Close')).show()
```

```
+-----+
|count(Close)|
+-----+
|          81|
+-----+
```

▼ What percentage of the time was the High greater than 80 dollars ?

In other words, (Number of Days High>80)/(Total Days in the dataset)

```
[27] 1 # Many ways to do this
      2 (df.filter(df["High"]>80).count()*1.0/df.count())*100
```

```
9.141494435612083
```

▼ What is the Pearson correlation between High and Volume?

```
[28] 1 from pyspark.sql.functions import corr
      2 df.select(corr("High","Volume")).show()
```

```
+-----+
|corr(High, Volume)|
+-----+
|-0.3384326061737161|
+-----+
```

▼ What is the max High per year?

```
[29] 1 from pyspark.sql.functions import year
      2 yeardf = df.withColumn("Year",year(df["Date"]))
```

```
[30] 1 max_df = yeardf.groupBy('Year').max()
      2 # 2015
      3 max_df.select('Year','max(High)').show()
```

```
+----+-----+
|Year|max(High)|
+----+-----+
|2015|90.970001|
|2013|81.370003|
|2014|88.089996|
|2012|77.599998|
|2016|75.190002|
+----+-----+
```

▼ What is the max Close for each Calendar Month?

In other words, across all the years, what is the max Close price for Jan,Feb, Mar, etc... Your result will have a value for each of these months.

```
1 from pyspark.sql.functions import month # hint
2 monthdf = df.withColumn("Month",month("Date"))
3 monthmax = monthdf.select("Month","Close").groupBy("Month").max()
4 monthmax.select("Month","max(Close)").orderBy('Month').show()
5
```

Month	max(Close)
1	90.470001
2	87.33000200000001
3	83.959999
4	81.029999
5	79.91999799999999
6	77.32
7	78.550003
8	78.769997
9	77.510002
10	78.290001
11	87.540001
12	86.910004

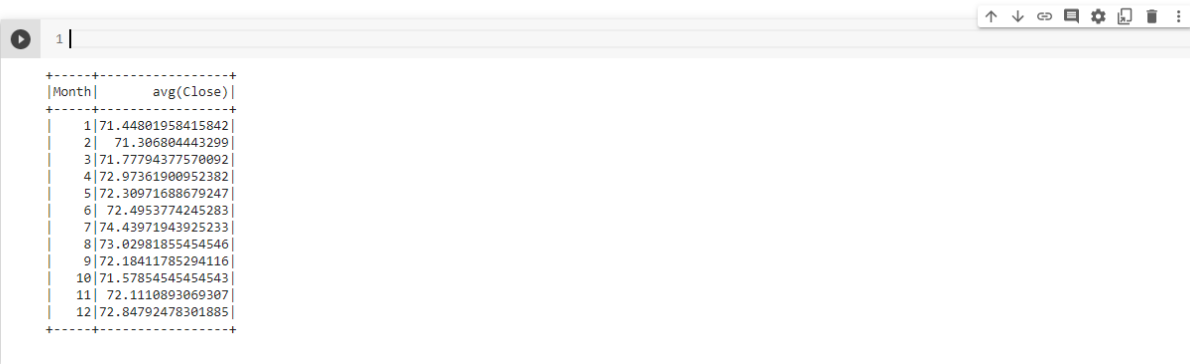

Check-Point-5:

1 point

Check Point 5

- ▼ What is the average Close for each Calendar Month?

In other words, across all the years, what is the average Close price for Jan,Feb, Mar, etc... Your result will have a value for each of these months.

The screenshot shows a Jupyter Notebook interface with a single code cell. The cell contains a table with two columns: 'Month' and 'avg(Close)'. The table lists the average closing price for each month of the year, indexed from 1 to 12. The values are displayed in scientific notation.

Month	avg(Close)
1	71.44801958415842
2	71.306804443299
3	71.77794377570092
4	72.97361900952382
5	72.30971688679247
6	72.4953774245283
7	74.43971943925233
8	73.02981855454546
9	72.18411785294116
10	71.57854545454543
11	72.1110893069307
12	72.84792478301885
